

# re-balance gel nails procedure

## nail enhancement essentials

ONYX Gels offers COMPLETE, a 3 in 1 gel along with pinks and whites that will allow you to create Perfect & Strong Enhancements every time.

## how-to guide

- 1 Perform a Prep Manicure on your client by completely removing excess cuticle tissue from the nail plate and pushing back the cuticle using PUSHY.
- 2 Shorten the nails the amount that has grown out.
- 3 Smooth the ledge between new growth and artificial nail. This should be blended completely. Do not file the natural nail. This area should be buffed to remove any shine or debris.
- 4 Reshape the body of the nail to maintain support in the correct areas, being careful to file away any loose material around the edges. Loose material left on the nail will trap moisture and bacteria. Note: If a French Fill is being performed, be sure to completely remove all of the existing white on the nail from previous application.
- 5 Dust the nail with SANI DUST and clean the nail thoroughly with FIRST & LAST.
- 6 Apply product to completely integrate new growth with previous applications.
- 7 Follow original application and finishing procedures. Do not forget to reinforce "H" structure at every fill.

## finger & toe tips:

-  Thorough preparation of the nail plate is required prior to the application of any nail enhancement product. Proper preparation will ensure the best service possible.
-  Be sure to remove ALL loose product to ensure a proper bond.
-  To ensure minimal heat transfer and maximum flexibility, apply gel in thin layers.
